#### CIRCUIT DESCRIPTION

This unit is configured as shown in the block diagram above.

The IC401/402 is the heart of the circuitry, and the IC404 is the man/machine interface e.g. upon pressing the PLAY button it enters the routine for activating the Play Mode, sending the Play command to the IC401/402 and entering the Play Mode A compact audio disc stores musical information in digital form.

This information is read back from the disc by a laser beam. Variation in the beam reflected from the disc is then converted into analog signals.

Below discuss how the information on the disc is converted into the original audio signal.

The variation in reflection of the laser beam are read as variations in the current by the photo diode in the pick-up section (by using the characteristics of the photo diode and that the current changes according to the amount of the light falling on to it), and then converted into a current signal. This current signal is added to the IC501 together with signals containing tracking and focus error, if detected by the photodiode.

These signals are then amplified by the IC501.

These signals, called EFM signal, contain not only musical information but also a sync signal, information on time and address called Q data, and CRC check signal.

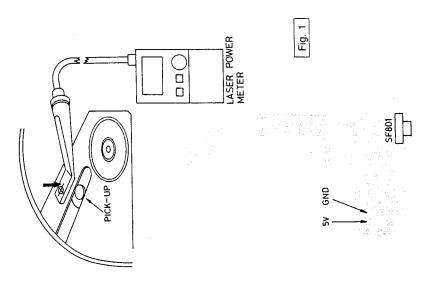

The signal are then applied to the IC402, where they are immediately stored in the RAM. Next, they are, when read back from the RAM, further divided into individual units of original information, being checked for data errors through the cyclic redundancy check. Any erroneous data is thus rewritten. Of these unit of information only the musical information is sent to the D/A converter, IC301, which converts 16-bit data input in 2's complement form to an analog signal containing 14-bit mantissa with 7-bit exponent which are proportional to the input digial signal. The analog signal thus generated by the D/A converter is then sent to the low pass filter and Audio amplifier IC101.

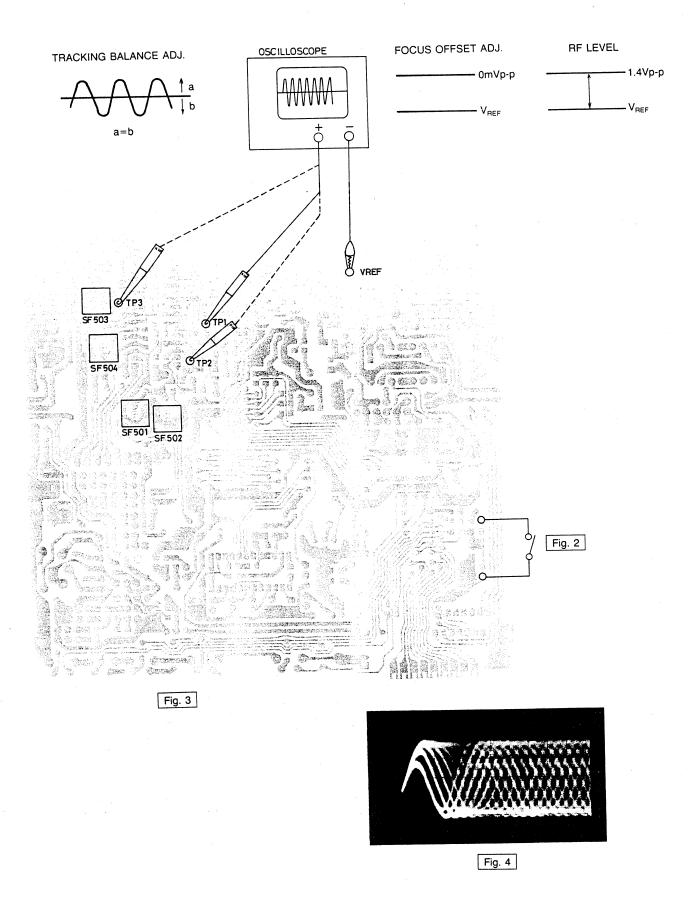

Music recorded on the disc is thus played by repeating the above sequences for the left and right channels alternately.
